PROFILE

QA and test automation engineer with over 12 years in quality assurance, more than seven of them fully remote with international teams. Builds web, API and mobile automation that runs as release gates in CI, and pairs it with careful investigation of the problems automation surfaces. Uses AI tools such as Claude Code and GitHub Copilot daily, and keeps nothing until it has run against the real product. This portfolio summarises selected work. Client work is described in general terms only; the public code sample shows the same practices in runnable form.

AT A GLANCE

- **12+** years in QA, **7+** of them fully remote
- **About 190** mobile end-to-end checks in a framework built from scratch
- QA led for platforms in **3 countries** (Kenya, Nigeria, Eswatini)

PROJECT 1: PUBLIC CODE SAMPLE (QA AUTOMATION SHOWCASE)

Link: github.com/Valuoch/qa-automation-showcase · **Live test report:** valuoch.github.io/qa-automation-showcase

A complete, runnable project against two public practice systems (a demo web shop and a demo booking API).

- **Web UI:** Playwright and TypeScript with page objects, in Chrome and Firefox. Covers login (including locked-out users and data-driven negative cases), sorting, cart, checkout totals and form validation.
- **API:** full booking lifecycle (create, read, filter, PUT, PATCH, delete), authentication and permission checks, and JSON Schema contract validation of every response.
- **Defects and findings recorded as tests:** three real UI defects documented as expected failures, plus two API findings (a failed login returns HTTP 200; invalid input returns HTTP 500 instead of 400).
- **Load and CI:** k6 smoke test with thresholds; a GitHub Actions pipeline (static checks, then tests and load in parallel, then the published HTML report), also run nightly.

Tools: Playwright, TypeScript, Ajv (JSON Schema), k6, GitHub Actions, GitHub Pages.

PROJECT 2: MOBILE END-TO-END FRAMEWORK, BUILT FROM SCRATCH

Context: Android app for a field-safety platform used by industrial workers. It runs on real devices and emulators with no mocked services.

- Designed and built 11 suites with about 190 automated checks: sign-in, multi-step forms, photo capture, digital signatures, offline capture and sync, and dashboards.
- Built a spreadsheet-driven runner so the documented test cases remain the source of truth, with results written back as a report.
- Introduced a known-issues baseline: a run counts as green when there are no new failures, and a known issue that starts passing is flagged for removal.
- Traced intermittent failures (dropped taps during redraws, native media pickers, emulator memory) to their causes instead of masking them with retries.

Tools: Appium, WebdriverIO, Node.js, Android emulators, GitHub Actions.

PROJECT 3: WEB CONSOLE AUTOMATION

Context: the same platform's React admin console.

- A fast regression suite that stubs every API call and the sign-in cache, so it runs without credentials.
- A second suite that maps each of 237 documented test cases one-to-one to an automated spec, with a tracked list of known gaps.
- Selectors based on roles and visible text, so tests survive redesigns.

Tools: Cypress, Playwright, TypeScript.

PROJECT 4: API QUALITY GATE

Context: the platform's .NET API, secured with Microsoft Entra ID.

- Playwright API tests across every documented operation, one client per resource.
- An offline coverage guard: CI fails if any documented endpoint has no test.
- A specification drift check that flags when the live API stops matching its OpenAPI document.
- k6 load and performance profiles per resource.

Tools: Playwright, OpenAPI, k6, OAuth 2.0 / Entra ID, GitHub Actions.

CASE STUDY: THE BUG THAT LOOKED LIKE SUCCESS

Situation: field workers capture records offline, and the app syncs them when signal returns. **What I found:** end-to-end tests on real devices showed records that the app marked as submitted but that never reached the server, because the API had rejected them and the app did not surface the error. **What I did:** traced the record from the device through the API to the database, reproduced the failure reliably, and reported it with evidence and impact. **Why it matters:** silent data loss is invisible in unit tests and in manual spot checks; only end-to-end checks on real devices caught it.

PROJECT 5: RELEASE-READINESS REPORTING

An automated pipeline that merges results from every suite and produces DOCX, PDF and XLSX summaries for stakeholders each release cycle, with a clear go/no-go recommendation and the remaining risks.

PROJECT 6: DIGITAL HEALTH ROLLOUT, KENYA

Supported an electronic medical records rollout across 40 health facilities in three counties, ran data quality assessments, trained facility staff and provided support for 44 sites. This field experience shapes how I judge the real cost of a defect.

HOW I WORK

- **Assert what matters:** totals that add up, records that arrive and permissions that hold, not only status 200.
- **Evidence for every call:** bug reports engineers can act on without a meeting, and release recommendations backed by results.
- **Flakiness is a bug:** intermittent failures are traced to their cause, not hidden behind retries.
- **AI with verification:** AI tools draft tests and analyse failures; a test counts only after it has been run and shown to fail when the behaviour is wrong.

EXPERIENCE

- **Corporate Quality Assurance Specialist**, Palladium · Remote · Oct 2023 – Present
- **Senior QA Engineer**, Acronis · Remote · Jan 2023 – Sep 2023
- **Quality Assurance Specialist**, Palladium · Remote · Oct 2018 – Oct 2022
- **HMIS Advisor**, Palladium · South Rift, Kenya · Oct 2017 – Oct 2018
- **Health Informatics / M&E Officer and Data/IT Assistant**, EGPAF · 2015 – 2017; **Data Analyst**, Population Council · 2012 – 2014

SKILLS AND EDUCATION

Automation: Playwright, Cypress, Appium, WebdriverIO, Selenium, TypeScript, JavaScript. **API and performance:** REST, OpenAPI, Postman, k6, JMeter, Grafana, SQL. **Delivery:** GitHub Actions, Jenkins, Docker, test strategy, release gates, UAT.

Education: MSc Software Engineering (Quantic School of Business and Technology); BSc Information Technology (Great Lakes University of Kisumu). **Certification:** Introduction to DevOps and Linux (Digital Regenesys, 2025). **Languages:** English (fluent), Swahili (native).

Availability: open to remote QA and test automation roles, and to relocation with visa sponsorship.
